CONSERVATIVE AND OPERATIVE MANAGEMENT

Springer Science & Business Media An intense discussion has recently begun regarding current standards in the diagnosis and treatment of benign prostatic hyperplasia (BPH). A number of factors have led to this discussion. In an increasing proportion of aging men, for example, BPH causes so-called obstructive symptoms that must be relieved by medical or operative means. This entails an immense social and economic impact in terms of health costs. In addition, recent data indicate the most frequently performed operation for BPH - transurethral resection of the prostate - is associated with a higher risk of death due to cardiac disease than open prostatectomy. Furthermore, studies using the recently developed technique of uro dynamics to assess bladder outflow obstruction reveal that about 20% -30% of patients treated with transurethral resection or open prostatectomy are actually not obstructed. This means that these patients do not receive the most effective therapy. Finally, various new treatment modalities have been developed, including medical treatment directed at endocrine pathways in the prostatic cells, balloon dilatation, spirals, temporary or permanent stents, and the application of heat in hyperthermia or thermo therapy. The contributions to this volume were selected from a symposium on the diagnosis and treatment of BPH. They are intended to provide a comprehensive review of the state of the art in treating BPH. ALTERNATE METHODS IN THE TREATMENT OF BENIGN PROSTATIC HYPERPLASIA

Springer Science & Business Media For many years, patients who complained

of prostatism had only a few treatment choices. The patient was either a candidate for an elective prostatectomy, or the operation was deferred until the patient became more symptomatic. The present text summarizes the multiple options which have become available to the practicing urologist. Minimally invasive techniques such as transurethral incision of the prostate, balloon dilatation, hyperthermia, laser therapy, and prostatic stents are described. Medical treatment with alpha-blockers, 5 alpha-reductase inhibitors, and flutamide are addressed by authors who have had extensive clinical experience with the use of these agents.

TREATMENT OF BENIGN PROSTATIC HYPERPLASIA

Springer Science & Business Media Benign prostatic hyperplasia (BPH) is an age-related, nonmalignant condition that may lead to bothersome lower urinary tract symptoms. The standard treatment of BPH has been ordinary loop transurethral prostatectomy, but new therapies have been developed as a combined result of research, technological advances, and the cumulative experience of urological surgeons. Among the most promising therapeutic alternatives to ordinary loop resection are those that deliver topical or interstitial heat to prostatic tissue. Transurethral microwave thermotherapy, visual laser ablation with the Nd:YAG laser, high-intensity focused ultrasound, and transurethral electrovaporization are some of the techniques described in this book. These innovative procedures, employed by skilled urologists using state-of-the-art instruments, hold forth the promise of improved quality of life for BPH patients and represent significant advances in the field of urology.

TREATMENT OF BENIGN PROSTATIC HYPERPLASIA: MODERN ALTERNATIVE TO TRANSURETHRAL RESECTION OF THE PROSTATE

Springer Treatment of Benign Prostatic Hyperplasia: Modern Techniques is an up-to-date review of modern techniques used to treat benign prostatic hyperplasia. It provides a comprehensive review of both office and operating room based techniques. Both electrosurgical and laser based techniques are covered. These include high powered 532 nm laser photoselective laser vaporization of the prostate (PVP), holmium laser enucleation/ablation of the prostate (HoLEP/HoLAP), and Bipolar Electrovaporization of the Prostate (Bipolar EVP/Bipolar TURP). In addition, a comprehensive review of office based techniques and future therapies currently being developed is presented. Each of these techniques are presented in a balanced fashion with a focus on modern literature.

Treatment of Benign Prostatic Hyperplasia: Modern Techniques will be of great value to Urologists, Urology Residents, Internists, and Family Practitioners.
