**Guidelines on Core Components of Infection Prevention and Control Programmes at the National and Acute Health Care Facility Level** *Health care-associated infections (HAI) are one of the most common adverse events in care delivery and a major public health problem with an impact on morbidity, mortality and quality of life. At any one time, up to 7% of patients in developed and 10% in developing countries will acquire at least one HAI. These infections also present a significant economic burden at the societal level. However, a large percentage are preventable through effective infection prevention and control (IPC) measures. These new guidelines on the core components of IPC programmes at the national and facility level will enhance the capacity of Member States to develop and implement effective technical and behaviour modifying interventions. They form a key part of WHO strategies to prevent current and future threats from infectious diseases such as Ebola, strengthen health service resilience, help combat antimicrobial resistance (AMR) and improve the overall quality of health care delivery. They are also intended to support countries in the development of their own national protocols for IPC and AMR action plans and to support health care facilities as they develop or strengthen their own approaches to IPC. These are the first international evidence-based guidelines on the core components of IPC programmes. These new WHO guidelines are applicable for any country and suitable to local adaptations, and take account of the strength of available scientific evidence, the cost and resource implications, and patient values and preferences.*

**Caring for People who Sniff Petrol Or Other Volatile Substances A Quick Reference Guide for Health Workers** *These guidelines provide recommendations that outline the critical aspects of infection prevention and control. The recommendations were developed using the best available evidence and consensus methods by the Infection Control Steering Committee. They have been prioritised as key areas to prevent and control infection in a healthcare facility. It is recognised that the level of risk may differ according to the different types of facility and therefore some recommendations should be justified by risk assessment. When implementing these recommendations all healthcare facilities need to consider the risk of transmission of infection and implement according to their specific setting and circumstances.*

**Immunisation against infectious diseases** *The Stationery Office This is the third edition of this publication which contains the latest information on vaccines and vaccination procedures for all the vaccine preventable infectious diseases that may occur in the UK or in travellers going outside of the UK, particularly those immunisations that comprise the routine immunisation programme for all children from birth to adolescence. It is divided into two sections: the first section covers principles, practices and procedures, including issues of consent, contraindications, storage, distribution and disposal of vaccines, surveillance and monitoring, and the Vaccine Damage Payment Scheme; the second section covers the range of different diseases and vaccines.*

**Rapid Infection Control Nursing** *John Wiley & Sons The Rapids are a series of reference and revision pocket books that cover key facts in a simple and memorable way. Each book contains the common conditions that students and newly qualified nurses encounter on the wards, in the community, and on placements. Only the basic core relevant facts are provided to ensure that these books are perfect and concise rapid refreshers. **Infection Management in Hematology** *Springer Nature This book provides a thorough update on the management of infections in patients with hematologic malignancies, focusing particularly on prevention, diagnosis, and treatment. Detailed attention is devoted to the central roles that vaccination and anti-infective prophylaxis have gained in improving overall survival in this patient group, in accordance with the principle that prevention is better than cure. Careful consideration is also paid to risk stratification, which is crucial in ensuring that anti-infective prophylaxis is targeted to those at the highest risk. While preventive strategies reduce the prevalence of infections, optimized management strategies are vital to decrease infection-related morbidity and mortality in those who nevertheless develop infections. Here, readers will find in-depth, up-to-date knowledge on the diagnosis and treatment of bacterial, fungal, viral, and parasitic infections, according to the affected organ and the causative pathogen. Finally, treatment in intensive care units is reviewed. The book will be of high value for hematologists, oncologists, and infection specialists.*

**Tutorial Topics in Infection for the Combined Infection Training Programme** *Oxford University Press, USA Microbiology and virology laboratories provide a diagnostic service that supports the management of patients under the care of front-line clinicians. Despite the significant overlap, laboratory expertise and clinical patient management are traditionally viewed as independent entities. Trainees in the infection disciplines of microbiology, virology, infectious diseases, and tropical medicine have until recently received separate, and as a result, limited training. To address this*

problem, the UK replaced the FRCPath Part 1 examination for infectious disease trainees with a combined infection training (CIT) curriculum in 2015. Based on the idea of integration and collaboration within the field, CIT links laboratory expertise to clinical patient management. *Tutorial Topics in Infection for the Combined Infection Training Programme* is the first book covering the complete CIT curriculum. Following the format of the CIT certificate examination, each chapter ends with three single best answer multiple choice questions accompanied by in-depth discussions. This extensive content helps students appreciate the breadth of knowledge required, emphasises how the different aspects of the field are related, and is an essential tool for those preparing for the CIT certificate examination. Written by a multi-disciplinary team of medical microbiologists, virologists, infectious disease physicians, clinical scientists, biomedical scientists, public health specialists, HIV clinicians, and infection control nurses, this well-illustrated and easy to use book offers a unique insight into infectious diseases. It is the perfect primer for further study, a starting point for medical students and professionals wishing to learn more about the different topics within the infection specialty, and ideal for biomedical scientists looking to broaden their clinical understanding of the field beyond the diagnostic test.

**Source Control A Guide to the Management of Surgical Infections** Springer Science & Business Media Source control is the key to the management of surgical infections. Surgical decision making is based on the marriage of evidence from clinical studies, inferences from biology, and the elusive component of surgical experience; this book combines these three elements. We have recruited an international group of authors who are acknowledged leaders in the field of surgical infectious diseases. We have challenged them to integrate evidence with experience and an understanding of biology so as to create overviews that will help the clinician who must make the difficult decisions. And we have kept them honest by asking a second group of equally eminent commentators to provide supporting or alternative views - in essence, to recreate the kind of dialogue that takes place between clinicians discussing a difficult problem. This is **THE** manual for the authoritative management of surgical infections!

Key points Practical guide to management of surgical site infections following orthopaedic procedures Fully revised second edition with new topics added Recognised editor and author team led by Philadelphia-based Javad Parvizi Previous edition (9789350902714) published in 2013 **Management of Periprosthetic Joint Infection A global perspective on diagnosis, treatment options, prevention strategies and their economic impact** Springer Periprosthetic joint infection (PJI) is among the most serious complications in the field of endoprosthetics. The number of PJIs is increasing worldwide and poses a real interdisciplinary challenge for everyone involved. For the patient concerned, it is necessary to promptly work out an adequate therapy solution to fight off the infection. Both the clinical experience of the surgeon and the proper diagnostic processes are prerequisite for the reliable detection and identification of an infection. The microbiologist is responsible for identifying the causative germs by screening the patient's synovial fluid and tissue samples. Based on the findings and subsequent resistance testing, the infectious disease specialist can recommend the appropriate antibiotic therapy. Furthermore, the clinical pharmacist is consulted regularly throughout the therapy to discuss the risk of potential drug interactions. The surgeon will proceed with the revision surgery, following defined algorithms. Adequate radical debridement of infected and necrotic surrounding tissue is the most important step towards a successful cure of the infection. Accompanying the surgery, anti-infective agents are given systemically and locally. While systemic application of anti-infectives mainly reduces the number of haematogenic-spreading planktonic germs, local application immediately forms a colonization barrier and protects the implant from sessile biofilm formation. Concurrently, antibiotics are actively released from the implant, resulting in local germ reduction. Thus, local agents are embedded in the concept of surgical PJI treatment as a reliable adjuvant measure and they sustainably support the successful outcome. In one-stage procedures, local agents are released from specialized antibiotic-loaded bone cements, while in two- or multi-stage procedures, local agents are released from corresponding temporary spacers (interim prostheses). Even from an economic standpoint, the combination of systemic and local agent application is meaningful. Furthermore, there are some interesting trends towards the coating of metallic implants to protect against biofilm formation on the implant surface. On the basis of their personal experience, specialists from all over the world present, explain and discuss preventive approaches, appropriate diagnostic strategies for detection, reproducible effective surgical treatments as well as the economic impact of PJI. The reader can use this book as a solid platform for comparing their own approach to PJI treatment with the specialists' recommendations. **HIV Infection in Children and Adolescents** Springer Nature This book serves as a reference work on pediatric HIV infection and covers the full bandwidth of topics from an introduction to pathogenesis and epidemiology, over the transmission of the HI virus, to clinical manifestations, treatment, and prevention strategies. Diseases and disorders occurring in HIV infected persons are discussed in detail. Treatment of the maternal condition often needs to be adjusted because of concerns for the fetus, and some conditions have a major impact on the method, mode, and timing of delivery. Many of the clinical problems that arise in pregnant women with a neurological disease have not been the subject of clinical trials, so management must often be based on what published evidence is available and a good understanding of the likely interactions between the condition and pregnancy and vice versa. The editors and contributors represent a team with considerable experience in this area. They offer their "best practice" advice as how to treat the mother effectively, ensuring fetal safety, as well as embracing a philosophy that the pregnancy of a woman with a neurological disease should be made as enjoyable and rewarding for her as is possible. **Basic Guide to Infection Prevention and Control in Dentistry** John Wiley & Sons A practical step-by-step guide for all members of the dental team Thoroughly updated, this new edition ensures all members of the dental team are up to speed on the practical aspects of infection prevention and control.
